Post Office Protocol (POP) allows you to retrieve email from a remote server through your third-party email client. You can access the email messages on your email account by configuring your email client with our POP settings.

To Set Up a POP or IMAP Account on Your Mobile Phone

1. Create an account with your mobile phone.
2. Locate the POP settings and set the following:
Email/Username
Your full email address.

Password

Your email account password.

Incoming Mail Server

For POP accounts, use pop.secureserver.net for your incoming mail server.

For IMAP accounts, use imap.secureserver.net.

Outgoing Mail Server

For POP or IMAP accounts, use smtpout.secureserver.net for your outgoing mail server.

For help with a specific mobile device, see the provider's help documentation:
